HealthConnect Rwanda — Week 7

Power BI Week 6 Baseline: Structural Validation and Test Plan

Baseline file: Week_6.pbix. This report uses the actual uploaded Power BI file and previously supplied HealthConnect data. Structural inspection is completed; live refresh, visuals, filters, DAX execution and performance are not certified because Power BI Desktop is unavailable in this environment.

PBIX structure inspected

The PBIX archive passed its ZIP integrity check. It contains 6 report pages, 90 visual definition files, and an embedded binary DataModel.

Executive Dashboard: 15 visual definitions. Entities referenced: Appointments, Doctor, Medical_Equipment, Patient_Feedback, Patients, Provinces, Revenue_Summary, Services.

Patient Analytics: 15 visual definitions. Entities referenced: Appointments, Doctor, Patient_Feedback, Patients, Provinces, Revenue_Summary, Services.

Clinical Analytics: 16 visual definitions. Entities referenced: Admissions, Appointments, Diagnoses, Laboratory_Tests, Patient_Feedback, Patients, Prescriptions, Services.

Financial Dashboard: 15 visual definitions. Entities referenced: Billing, Departments, Insurance_Claims, Patient_Feedback, Patients, Payments, Revenue_Summary, Services.

Operational Dashboard: 17 visual definitions. Entities referenced: Administrative_Staff, Admissions, Beds, Departments, Doctor, Medical_Equipment, Nurse, Patient_Feedback, Patients, Pharmacist, Radiographer, Rooms, Services.

Patient Experience: 12 visual definitions. Entities referenced: Appointments, Beds, Departments, Doctor, Nurse, Patient_Feedback.

Testing findings and required refinements

PBI-01 — Critical: Appointment-to-billing completeness

Evidence: 60,000 billing rows; 55,000 billing AppointmentIDs not present in 5,000-row appointments extract. Action: Restrict joined KPIs to validated matching keys; obtain full appointment extract.

PBI-02 — Critical: Department / facility consistency

Evidence: 4,744 of 5,000 appointment rows disagree with the facility associated with their DepartmentID. Action: Resolve canonical facility and department keys before facility-level slicing.

PBI-03 — High: Billing, payment and claims measures

Evidence: Billing total 9,309,401,961; payment total 8,389,454,556; claims total 4,881,863,293.88 (claims subset). Action: Use separate measures for billed, paid and claimed; avoid combining unlike scopes.

PBI-04 — High: Patient feedback linkage

Evidence: 19,308 of 21,064 feedback AppointmentIDs unmatched to appointment extract. Action: Do not use appointment-derived facility/date slicers on unmatched feedback without a completeness note.

PBI-05 — High: Bed utilization

Evidence: All 2,000 bed statuses are Available in supplied extract. Action: Avoid presenting available-bed snapshot as occupancy or utilization.

PBI-06 — Medium: Claims status interpretation

Evidence: 21,008 Approved and 21,028 Pending in 42,036 claim rows. Action: Label status distribution as extract-only; do not infer claim rejection rate.

PBI-07 — Medium: Source duplication

Evidence: HC_Services (2).csv duplicates HC_Services.csv; Payments.csv duplicates HC_Payments.csv. Action: Keep one canonical model table for each dataset; retain originals separately.

PBI-08 — Medium: Data model and visual execution

Evidence: PBIX includes a binary DataModel; report definitions are inspectable but Desktop execution is unavailable here. Action: Open file in Power BI Desktop, run Refresh, inspect errors, DAX measures and relationship cardinality.

Test → Finding → Action → Retest → Validated Improvement

Completed: archive integrity, page and visual inventory, source-data relationship and reconciliation tests. Pending: Power BI Desktop open/refresh, relationship and DAX execution checks, page-by-page interaction tests, filter cross-highlighting, KPI comparisons and screenshot evidence. No pending runtime test is represented as passed.

Submission note

The original PBIX is included unchanged. The Excel structural audit provides page/visual inventory and a prioritized retest register. The previously produced Week 7 report and addenda remain in the package. Do not claim a revised PBIX or runtime-tested dashboard until the Power BI Desktop checks are completed.
